## If getting subpoenas signed still involves a **courier and a bicycle...**

---

How much time could your associates, partners, and support staff save if you didn't need to download, print, sign, scan, and upload signed subpoenas?

How much could you improve your internal workflows if, rather than having to print, sign, and scan your subpoena, it was made easy for them to click a few buttons and drop in their electronic signature from anywhere?

## Not all eSignatures are equal in **the eyes of the law**

---

Despite having moved most of their operations to digital platforms – every firm's workflow involving a signature forces their attorneys out of those digital environments and into the analog world of paper and pen.

Many of these firms have been understandably reluctant to adopt eSignatures. After all, attorneys know that the law treats electronic signatures very differently depending on what the parties can or can't prove about those signatures. To satisfy the conditions of the federal E-Sign Act of 2000, for example:

- ☑ You must be able to prove the eSignature was in fact added by the party to the agreement (in other words, not forged).
- ☑ You must be able to prove the signer intended to sign the contract (thereby demonstrating agreement with the document's content).
- ☑ You must be able to prove the signed version of the subpoena is the final version (i.e., the document has not been altered or tampered with since the signature was added).
- ☑ For deadline-based subpoenas or other legal documents, you'll be required to prove the date that the signature was added.

The traditional electronic signature process – dropping a digital image of a handwritten signature into a PDF – would fall short of legal viability on every count above. You can't prove who dropped in that digital image, when they did so, whether they knew what they were signing, and that the document hadn't been altered after the signature was added.

Unfortunately, though, many of the commercial eSignature apps on the market today also fall short

of these legal proof points. And that's primarily due to the fact that most eSignature solutions don't use the most decentralized, secure, and tamper-proof technology – blockchain – to record and store their signatures.

Which is why the Compex eSign solution, powered by jSign is built on blockchain technology.

## What Compex and our easy-to-use eSign solution **can do for your firm**

---

In addition to helping make your subpoenas eSignature compliant with eSign and other relevant laws, implementing the Compex eSign solution can save your staff enormous amounts of time, and help you create an outstanding client experience.

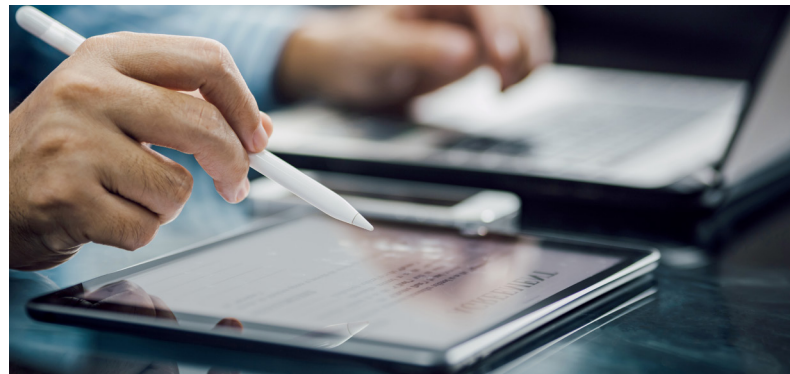

Here are just a few ways that implementing the Compex eSign capabilities into your workflow can improve operations across your firm.

### **1. Speed and improve your internal process.**

If your firm is like many we speak with, you're still stuck gathering signatures on subpoenas the slow and tedious way. Your staff downloads and prints these documents but does not have an automated, digital process for collecting the signatures.

That means printing, adding a "wet" signature, and scanning the document back in, making the process longer than is necessary.

With the Compex eSign solution, you can easily embed full-featured electronic signature capability into your subpoena signing process.

## 2. Nail down witness statements and other key documents more quickly.

Let's say your staff frequently needs to sign subpoenas. The signature step is probably the most challenging and time consuming.

Those extra, time-consuming steps likely mean that you'll be waiting longer for the medical records to be returned to your staff.

But by using **the Complex eSign solution**, you can build eSignature functionality right into your standard subpoena signing process. That will allow your attorneys to easily add their signature with just a click or two after reviewing the document.

No more hours- or days-long waits for signing subpoenas.

Note: The verifiable authenticity of your signatures will be essential. And here's where the Complex eSign solution's unique security and tamper-proof features – and our use of blockchain – will prove valuable. Using the Complex eSign solution, powered by jSign, to collect these eSignatures means your firm will be able to prove the who (through IP addresses and GPS tracking of the signature site), the when (through timestamping), and the signer's intent (through mandatory signer acknowledgments).

### About Complex

Complex Legal Services is accelerating insights to solve insurance claims through the power of technology. We are the industry leader in record retrieval, medical record summarization, and deposition reporting services. Enabled by industry-leading technology, we empower clients to retrieve the records they need—and capture the insights within them—faster and more cost-effectively.
